

# Socializer

Distributed social network event extractor

## Installation Guide

***Radek Burget***

# Socializer Installation Guide

---

Socializer downloads and extracts the events from the social networks and stores them in a central RDF repository provided by Halyard. The tool consists of a single JAR file ( `socializer-1.0-jar-with-dependencies.jar` ) that may be used locally or in the Hadoop cluster as described in the [User guide](#). It expects the running HBase and Halyard installation in the target cluster.

## Halyard installation

---

[Halyard](#) is a scalable repository that uses rdf4j and Apache HBase for data storage. The Halyard infrastructure must be installed according to the [installation manual](#). Socializer uses a direct access to the underlying HBase tables.

## Using the Pre-packaged Tool

---

The pre-packaged tool may be downloaded from [Releases](#).

## Building from sources

---

The package is built automatically using maven.

## Halyard Common dependency

The application requires `Halyard-Common` dependency, which is not in standard Maven repository. To install it into your local repo, run this command in application root folder.

```
mvn install:install-file -Dfile=libs/halyard-common-1.4-SNAPSHOT.jar -DgroupId=c
```

## Building the Package

Use the following command line to build the JAR package:

```
mvn clean compile assembly:single
```

The created JAR file will be found in the `target` folder.
